CortexHR Phase 3

Test Results Report

Run date: 2026-11-06 | Scope: requested Tasks 4, 12, 13 and 14

Overall result

All four requested test suites passed. Task 14 report consistency checks also passed (41/41).

Task	Test command (from task folder)	Result	Warnings	Duration
4	python -m pytest tests -q	110 passed	11	40.76 s
12	python -m pytest -q	50 passed	0 reported	49.06 s
13	CORTEXHR_ML_SRC set; pytest task13\tests -q	21 passed	106	51.40 s
14	python -m pytest task14\tests -q	48 passed	185	222.27 s

Execution details

- Task 4 ran from task 4\files\cortexhr-ml. The 11 warnings were joblib/NumPy deprecation warnings.
- Task 12 ran from task12 after correcting pytest.ini to use testpaths; the README now documents 50 tests.
- Task 13 ran with CORTEXHR_ML_SRC pointing to the local Task 4 package src folder.
- Task 14 ran from task14. The re-recorded Task 13 workspace integrity check reported 31/31 files matching.

Git tag

phase-3 was pushed to origin/main at commit c335ab6.

This report was generated after the tag push; the tag points to the preceding code/documentation commit.

Warnings and interpretation

Task 13 and Task 14 model-version warnings

Both suites passed, but model-loading tests emitted scikit-learn InconsistentVersionWarnings: the serialized attrition-v2 model was built with scikit-learn 1.8.0 and loaded under 1.9.0. Task 14 also emitted a runtime version warning. Keep the model build/runtime versions aligned (the Task 14 README specifies scikit-learn 1.8.x) before relying on model outputs.

Task 14 additional warnings

The 185 warnings include NumPy 2.5 joblib deprecations, in addition to the model-version warnings. They did not cause test failures.

Task 14 integrity-snapshot caveat

The previous integrity check failed because Task 13 README.md had changed and reports/task14.code-workspace was an additional file. The local baseline was deliberately re-recorded to 31 files and now verifies the current workspace. This does not independently prove that every file matches the delivered task_13.zip; the model.joblib SHA-256 remained a729dc24d2fc1b3ee7b728420e813c66be54895487a3345eb0b3cdc528caf79f.

Scope

This report covers only Tasks 4, 12, 13 and 14, as requested. It is a test summary, not a full Phase 3 model validation, fairness approval, or production-readiness assessment. Protected data and individual-level outputs are not included.
